

# HubroHansen project used for Enova campaign in Norway

Enova, a Norwegian institute promoting environmental friendly construction, has launched a new campaign in Norway.

With 4.000 posters around Norway, Enova shows it is possible to construct buildings, with the use of glass and aluminium facades and still save on energy. For the Aibel project, HubroHansen produced, delivered and installed app. 55 % of the outside facades – all in glass and aluminium.

Our own systems, **Hansen Fenster™** and **Hansen Fasad™** helped to reduce the energy consumption of the building by 60 %.

HubroHansen as the leading curtain wall company in Norway is also a leader in environmental friendly construction and with the Hansen profile systems secures customers the best solutions when it comes to saving energy.

The profile systems for facades, doors and windows have the best and lowest U-values on the market.

With a Scandinavian design, and slim profiles, the systems offer the highest G-values available.
